Latin UNUS and the discourse properties of unity cardinals

Abstract

This article investigates the discourse behaviour of Latin *unus* (‘one’) in the *Vulgate*, in order to better understand the starting point of the grammaticalization process ultimately leading to an indefinite article. To this end, I will study unity cardinals in general, focusing particularly on English *one*. Empirically, it will be shown that *unus* behaved like a unity cardinal in late Latin, without showing any clear sign of ongoing grammaticalization towards an indefinite article. I will try to explain the discursive behaviour of unity cardinals with reference to *antipresuppositions*, within the framework of the *game of same and different*. Finally, I will sketch how the results fit within the general picture of the incipient grammaticalization of indefinite articles, by providing an account of so far unexplained scope phenomena.

Keywords: UNUS, unity cardinals, *Vulgate*, discourse, grammaticalization

Résumé

Le présent article étudie le comportement discursif de *unus* (‘un’) dans la *Vulgate*, pour atteindre une meilleure compréhension du début du processus de grammaticalisation qui mène vers les articles indéfinis. Pour ce faire, j’étudierai les cardinaux d’unité plus en général, dont principalement *one* en anglais, dans le cadre du *jeu de l’identité et de la différence*. D’un point de vue empirique, je montrerai que *unus* se comporte comme un cardinal d’unité, sans montrer des signes clairs d’une grammaticalisation vers un article indéfini. J’essaierai d’expliquer le comportement discursif de cardinaux d’unité par les *antiprésuppositions*, dans le cadre du *jeu de l’identité et de la différence*. Pour finir, je fournirai une esquisse de la manière dont les résultats cadrent avec le début de la grammaticalisation des articles indéfinis, en donnant une analyse pour des phénomènes de portée qui étaient jusqu’à maintenant restés sans explication.

Mots-clés : UNUS, cardinaux d’unité, *Vulgate*, discours, grammaticalisation

I had the opportunity to present previous versions of this article at workshops at the universities of Paris 7 and Paris 8, and at the 2016 conference on *Formal Diachronic Semantics* in Konstanz, and I would like to thank the organizers and the audience for their helpful feedback. I would particularly like to thank Claire Beyssade, who convinced me to abandon my initial approach. I am also extremely grateful for the remarks and criticisms of the anonymous reviewers and the editors of this issue, which have allowed me to improve this article considerably. Igor Yanovich deserves special credit for his patience and never-ending efforts to bring the article into a publishable state. Finally, Heather Newell and Yannick Morin did a great job editing the final paper. All remaining errors and omissions are mine alone. This article is dedicated to the memory of Helmut Häusle.

1. INTRODUCTION

The present article provides a study of the Latin unity cardinal *unus*, which is the diachronic source of indefinite articles in Romance languages. I will focus mainly on its behaviour in discourse in Jerome’s *Vulgate* (late 4th century CE). My main empirical claim will be made in section 2, where I will show that *unus* had not yet acquired non-cardinal uses, and that all uses of *unus* are attested for the unity cardinal *one* in contemporary English. This claim argues against the proposal that the first clear attestations of indefinite article uses appeared in the *Vulgate* (claimed notably by Coleman 1991).

In section 3, I propose a formal semantic analysis of unity cardinals, and also provide an account of how their distribution is impacted by their potential alternatives (bare nouns in Latin, the indefinite article in English), based on previous work by Grønn and Sæbø (2012). The aim of this section is to drive home the idea that the distribution of a linguistic item does not only depend on its intrinsic meaning and properties, but also on the meanings and properties of alternatives a speaker might choose.

Based on this, I will provide in section 4 a tentative account of the first steps of grammaticalization of indefinite articles. The main claim here is that scope phenomena that have been observed in the grammaticalization literature can be explained as being motivated by Horn’s division of pragmatic labor between bare singulars and NPs modified by unity cardinals, and that in earlier stages of development the marked unity cardinal is used for marked semantic (and, notably, scope) configurations.

1.1 From unity cardinals to indefinite articles

We know that unity cardinals (i.e., cardinals expressing the number 1, e.g., English *one*) are one of the diachronic sources of indefinite articles (see Kuteva et al. 2019: 299ff.). There is also a great wealth of literature in formal (and other) semantics on the indefinite article, from many differing perspectives and in different frameworks (see, among many others, Heim 1988, Hawkins 1991, Kamp and Reyle 1993, Reinhart 1997, Brasoveanu and Farkas 2011, Steedman 2012, Grønn and Sæbø 2012). Therefore, we have a comparatively good understanding of one stage in the grammaticalization process. There is also a good amount of literature on the direction of change for a few language families (for instance, in Romance, see, e.g., Carlier 2001 2013, Pozas Loyo 2010)), and we thus have a good idea of the general direction of change. However, as far as I am aware, there has been a rather generalized lack of interest in the meaning and behaviour of the diachronic origin of these indefinite articles (but see Dahl 1985 for an exception to this rule). Therefore, we unfortunately know very little about the behaviour that is to be expected from a unity cardinal. Without a good understanding of the starting point, we cannot hope to grasp the overall development of indefinite articles, and may even fail to discern what is new behaviour for them at any given point in time. Furthermore, the fact that a more recent point on the developmental path is so much better understood than its origin may introduce a teleological bias in the review of the data. The main aim of this article is therefore to show that the discourse behaviour of unity cardinals is far from trivial, and that

examples of type (1) do not cover the whole picture of the use of a standard unity cardinal.

- (1) John drank one bottle of beer.

The received standard-model of the grammaticalization of indefinite articles is provided by Heine (1997: 72ff.), based on earlier work by Givón (1981). It proposes a five-stage framework of the process, which is depicted in (2).

(2)

Stage 1	Stage 2	Stage 3	Stage 4	Stage 5
numeral	presentative	specific	nonspecific	generalized

The different initial stages (1–4) are mainly distinguished by their discourse (and scopal) behaviour, whereas in later stages (4–5) the disappearance of selectional restrictions regarding the modified noun also come into play. English ‘one’ (as seen in (1)) is a typical representative of the numeral in stage 1. Heine (1997: 72) characterizes the ‘presentative marker’ stage 2 as follows:

This stage is reached when the article introduces a new participant presumed to be unknown to the hearer and this participant is taken up as definite in subsequent discourse [...]

Stage 2 uses would correspond to determiners which appear to introduce important characters at the beginning of a story, as in (3), but do not appear systematically with secondary characters, or in contexts of the specific use of a noun phrase.

- (3) Once upon a time, there was a king ...

Heine (1997: 72) insists on the importance of subsequent mentions following the use of the element introduced by *one*. Furthermore, presentatives have obligatorily wide scope, and narrow scope behaviour does not resurface until much later (in stage 4).

A stage 3 indefinite article is only employed to introduce specific uses of a noun (see (4a)), but does not appear in non-specific uses (see (4b)).

- (4) Yesterday, I met an opera singer ...
 a. ...namely Rolando Villazón.
 b. ...but I have no idea who that was.

English *a(n)* is a stage 4 indefinite article, since it can be used in both specific and non-specific contexts, but is restricted to singular count nouns, and cannot combine with plural count nouns or singular mass nouns, as is illustrated in (5). A full stage 5 indefinite article would be acceptable in all three of these contexts.

- (5) a. I saw a singer.
 b. *I saw a singers.
 c. *I saw a money.

As far as I am aware, researchers in the grammaticalization tradition generally seem to have taken the cardinal stage to be unproblematic; ¹ Heine (1997: 72), for instance, devotes only 5 lines to stage 1 of the process. As I will try to show in this article, since both discourse and scopal behaviour of these forms is extremely important, we have to thoroughly investigate the behaviour of unity cardinals in these contexts.

One of the puzzles this received grammaticalization theory poses in the context of the development of scopal behaviour is that it assumes that aspects of the scope behaviour of the cardinal simply disappear in stages 2-3, and reappear at stage 4. This contrasts with hypotheses like the one in Pozas Loyo (2010), which assumes that there is not much *meaning* change involved between a unity cardinal and indefinite articles, and that changes primarily concern frequency of use. More generally, in Heine’s received grammaticalization-theory plot of the evolution of indefinite articles, there is no explicit link between known meaning components of the cardinal, and stages in the model. Consider (6):

(6) Every donkey ate one carrot.

In the most probable reading of (6), *one carrot* takes narrow scope with respect to *every donkey*, so taking wide scope is not intrinsically linked to the semantics of the unity cardinal. In Russian, an unaccented cardinal has precisely this restriction on wide-scope readings (see Heine 1997: 72), while accentuated cardinals can appear with narrow scope.² Of interest here is that it is uneconomical to assume that narrow-scope readings systematically disappear and reappear in the grammaticalization process of indefinite articles, and the different choices that speakers make with regards to the scope of unity cardinals needs to be explained.

Here I establish a more solid baseline for what can be expected from a unity cardinal by investigating the discourse behaviour of English *one*, and seeing how it can be used to explain the discourse behaviour of Latin *unus*. The general idea is that – since *unus* is a less economical form than a bare nominal in Latin (or the indefinite article in English) – its presence must somehow be motivated. To this end, I will integrate a formal characterization of unity cardinals into the framework of Grønn and Sæbø (2012). Based on this investigation, I will then take a glance at the developmental stages in the rise of indefinite articles, and how they can be explained.

I have chosen the *Vulgate*³ (a translation of the Bible by St. Jerome, ≈ 347–420 CE, commissioned by Pope Damasus in 382), because it contains certain uses of *unus* *N*⁴ that have been claimed to be ‘innovative’, in the sense that they look suspiciously like

¹The exceptions to this lack of interest in unity cardinals come mainly from formalist traditions, and principally investigate the morphosyntax of unity cardinals (see Borer 2005, Barbiers 2005 2007). In the present article, morphology and morphosyntax will not be considered.

²As pointed out by Igor Yanovich, one can interpret this in the sense that the unaccented cardinal is no longer a strict cardinal.

³I am aware that the *Vulgate* as a translated and sacred text is at least potentially problematic; please refer to the Note in section 5 for an assessment of potential pitfalls.

⁴In this article, I will deal only with the adnominal use of *unus*. It also has pronominal uses – just like English *one*.

modern indefinite articles, see, for example, Matthew 26:69, classified by Coleman (1991: 390) as one of the ‘*unequivocal examples of articular meaning*’ (that is: with the meaning of an indefinite article):

- (7) [...] et accessit ad eum una ancilla dicens [...]

[...] and came to him UNUS maid saying [...]

‘and a maid came to him [Petrus] and said’

Una ancilla in (7) introduces a new discourse participant, and is generally translated by the indefinite article in English versions of the Bible, rather than a unity cardinal (which would sound odd here). As we will see below in (13), however, (7) can be explained (away) as a standard cardinal use of *unus*.

However, before being able to tackle the issue in Latin, we will need to investigate uses of the unity cardinal *one* in English, in order to get a better understanding of how these expressions are used in discourse. While the English article system is clearly different from that of late Latin, this will provide us with a baseline against which ‘grammatically advanced’ uses of unity cardinals can be evaluated.

1.2 Unity cardinals in discourse: a preliminary look at English *one*

The present section is not meant to provide an exhaustive description of the discursive uses of *one* in English. Its purpose is merely to describe the basic pattern in order to better understand the facts in the *Vulgate*. I have chosen English *one* as a blueprint for establishing the discourse-semantic meaning of *unus* because in English, the unity cardinal *one* is morphologically clearly distinct from the indefinite article *a* (contrary to, e.g., Romance languages, or written standard German). Furthermore, one would expect *one* to be unaffected by any ongoing process of grammaticalization, since the presence of the indefinite article *a* should block it. I will come back to a more precise characterization of the constraints on the use of *one* in section 3.

According to standard dynamic semantics (e.g., Kamp and Reyle 1993), indefinite articles introduce new discourse participants. This is also the case for many uses of *one* in English. A first use, which I will refer to as the *partitive use*, introduces a new referent into the discourse, which is part of a larger entity previously introduced into the discourse. Consider (8).

- (8) We saw a lot of cows_{*I*}. [One cow]_{*i* ∈ *I*} appeared to be looking at me with an attitude like, “What? You never saw a cow before?” internet example

The entity denoted by *one cow* in (8) is in a sense discourse new. Yet, it also is a part of a plural discourse referent already introduced (*a lot of cows*).

With an indefinite article, a partitive reading is difficult to get:

- (9) We saw a lot of cows_{*I*}. #[A cow]_{*i* ∈ *I*} appeared to be looking at me with an attitude.

One is also often used in contrastive contexts, either when there is a contrast to another token of the same kind (see (10a)), or when there is a contrast between two cardinals (see (10b), which I will refer to as *numeral contrast*):

- (10) a. One cow was looking at me; another (cow) simply ignored me.
b. Peter drank one bottle of beer; Fred had three (bottles).

In both contexts, the indefinite article would be slightly strange.⁵ Notice, however, that the indefinite article does not generally exclude partitive interpretations; they are only not very salient in most contexts.

- (11) That wasn't A reason I left Pittsburgh, that was *THE* reason.⁶

However, as shown by (9), the indefinite article cannot refer back as a partitive anaphora to a close and explicitly given plural antecedent.

The Latin determiner system is not identical to the one in contemporary English (English has fully grammaticalized indefinite and definite articles, whereas Latin has bare noun (phrases) and a rather limited use of *ille* – which is the ancestor of most Romance definite articles). However, as we will see, this preliminary investigation gives us a useful blueprint for what uses we should be looking at in Latin.

Generally, the point is that the more an occurrence of *unus* looks inexplicable in terms of a unity cardinal, the more we will be tempted to classify it as an indefinite article. Therefore, knowing what to expect is crucial.

The remainder of the article is structured as follows: based on our summary description of English *one*, we will look in more detail at uses of *unus* in the *Vulgate* that seem to be problematic. Then, we will go back to English in order to better characterize the meaning of unity cardinals in terms of their antipresuppositions (see Percus 2006, Sauerland 2008, Grønn and Sæbø 2012, Amsili and Beyssade 2016), and apply these ideas to Latin. A section describing the changes required for a unity cardinal to become an indefinite article concludes the article.

2. A DETAILED LOOK AT ‘INNOVATIVE’ USES OF ADNOMINAL UNUS IN THE *VULGATE*

In this section I will take a detailed look at instances of adnominal uses of *unus* which appear at first sight to be indefinite articles, that is, where there are no motivations for the presence of a unity cardinal in the immediate vicinity.⁷ Each time, I will try to

⁵The two editors of the CNJ did not agree on the infelicity of the indefinite article in (10b). However, I still think that both sentences are slightly odd if they are planned in advance as setting up an opposition between the two cows, or between Peter and Fred. See also footnote 22 on the importance of rhetorical relations like CONTRAST.

⁶Example cited from Abbott (2004: 125).

⁷Through a corpus search, all instances of *unus* in the *Vulgate* were extracted, examined, and annotated for features relevant for the appearance of the unity cardinal (e.g., partitivity, contrast elements, etc.), as well as syntactic features (position with respect to the noun, etc.). This allowed me to isolate cases where the motivation for the presence of *unus* was not obvious. I will not be able to go into *all* such instances here; I will try, however, to show that there are rather typical instances which do seem like unity cardinals, based on our use cases of *one*, whereas others are more problematic.

identify elements that may have motivated the use of *unus*. Since the earliest stages of grammaticalization of the indefinite article are assumed to involve major characters in a story,⁸ I will also comment on the respective importance of the character.

Most uses of *unus* in the *Vulgate* are entirely unproblematic, given an analysis as a cardinal: they are either used in contrastive contexts (see (12a)), or in partitive contexts like (12b–c).⁹

- (12) a. itaque iam non sunt duo sed una caro [...] Matthew 19:6
therefore already NEG are two but one flesh [...]
‘Therefore now they are not two, but one flesh.’
- b. tunc crucifixi sunt cum eo duo latrones unus a dextris et unus a
then crucified are with him two thieves one at right and one at
sinistris Matthew 27:38
left
‘Then were crucified with him two thieves: one on the right hand and
one on the left.’
- c. [...] propheta unus de antiquis surrexit Luke 9:8
prophet one of old rose
‘one of the old prophets (lit. one prophet of the old) has resurrected’

In what follows, I will look at uses of *unus* that are both adnominal and which I have classified as introducing a new discourse participant, and therefore, might be instances of an indefinite article.¹⁰ Often, in looking at the larger context, the motivation of the use of *unus* will become clear.

⁸See Heine (1997: 72): “An early stage II situation would obtain in a language where the article is confined to the beginning of a narrative discourse—for instance, where the *main participants* are introduced with the presentative article at the beginning of the tale.” [emphasis mine].

⁹A general note on the rendering of Bible verses: All English translations of Bible verses have been taken from the Douay-Rheims English version, and cited according to <http://www.latinvulgate.com>. For different Greek versions of the Bible, I have used Aland et al. (2012) and Hodges and Farstad (1985). The version of the *Vulgate* I used is the one from the *Bibliotheca Augustana* (see Harsch 1996–). If the text from the Bible is sufficiently short, I have provided glosses; for longer passages, where glossing is not practical, I only provide the translation.

¹⁰There are six attestations in the New Testament out of 298 total (2.01%) which satisfy this description; in the Old Testament, 16 attestations out of 723 (2.22%) correspond. For reference, these are the verses in which potentially problematic uses of *unus* appear:

New Testament: Matthew 8:19, Matthew 9:18, Matthew 21:19, Matthew 26:69; Mark 12:42; John 6:9

Old Testament: Judges 9:53; 1 Samuel 1:1; 1 Kings 20:13, 1 Kings 20:28, 1 Kings 20:39, 1 Kings 25:19; 2 Chronicles 18:7; Nehemiah 4:2; Judith 5:9, Judith 14:16; Ezekiel 8:7, Ezekiel 8:8, Ezekiel 33:2; Daniel 2:9; Zechariah 5:7

2.1 Clear cases of cardinal use with unusual distance

To begin, let us have a second look at (7) – which was supposed to be a clear instance of an article use – in a slightly larger context (Matthew 26:69–71).

- (13) 69 Petrus vero sedebat foris in atrio et accessit ad eum **una ancilla** dicens et tu cum Iesu Galilaeo eras 70 at ille negavit coram omnibus dicens nescio quid dicis 71 exeunte autem illo ianuam vidit eum **alia** et ait his qui erant ibi et hic erat cum Iesu Nazareno
69 But Peter sat without in the court. And there came to him a servant maid, saying: Thou also wast with Jesus the Galilean. 70 But he denied before them all, saying: I know not what thou sayest. 71 And as he went out of the gate, another maid saw him; and she saith to them that were there: This man also was with Jesus of Nazareth.

It turns out that (13) – instead of being a clear instance of a (proto-) indefinite article – is clearly an instance of a contrastive use: *una ancilla* as opposed to *alia*. However, the distance between these two elements is abnormal (viewed from the perspective of contemporary English):¹¹ there are two instances of direct speech between the occurrences of *unus* and its contrasting *alius*, as well as their introductory formulæ. Furthermore, *una ancilla* in (13) is quite close to a throw-away referent:¹² it refers to an extremely secondary character, and is not taken up again. Notice that such occurrences of *unus* are not what one would expect from a stage 2 presentative, which should mark important, and salient characters at the beginning of a tale (see Heine 1997: 72).

The same pattern (‘standard’ use, non-standard distance) also obtains in Judges 9:53 (here in the enlarged context of Judges 9:51–54).

- (14) 51 erat autem turris excelsa in media civitate ad quam confugerant viri simul ac **mulieres** et omnes principes civitatis clausa firmissime ianua et super turris tectum stantes per propugnacula 52 accedensque Abimelech iuxta turrem pugnabat fortiter et adpropinquans ostio ignem subponere nitebatur 53 et ecce **una mulier** fragmen molae desuper iaciens inlisit capiti Abimelech et confregit cerebrum eius 54 qui vocavit cito armigerum suum et ait ad eum

¹¹To see this, apart from the fact that no English translation I have seen uses the unity cardinal and a bare *other*, consider the following, more direct translation of the passage:

- (i) Peter sat out in the courtyard. And then came to him one servant maid, saying: “*You were with Jesus the Galilean, too.*” But he denied before them all, and said: “*I don’t know what you are talking about.*” And as he went out of the gate, another saw him, and she said: “*This one here was with Jesus of Nazareth.*”

In English, it is difficult to get the intended antecedent of *another* in (i) – probably because of the intervening “*before them all*” – but in the Latin text, where gender is marked on the pronoun, *una ancilla* is the closest matching antecedent.

¹²Chiara Gianollo (p.c.) suggested this term for extremely ephemeral discourse referents.

evagina gladium tuum et percute me ne forte dicatur quod *a femina* interfec-
tus sim qui iussa periciens interfecit eum

51 And there was in the midst of the city a high tower, to which both the men and the women were fled together, and all the princes of the city, and having shut and strongly barred the gate, they stood upon the battlements of the tower to defend themselves. 52 And Abimelech, coming near the tower, fought stoutly: and, approaching to the gate, endeavoured to set fire to it: 53 And behold, a certain woman casting a piece of a millstone from above, dashed it against the head of Abimelech, and broke his skull. 54 And he called hastily to his armourbearer, and said to him: Draw thy sword, and kill me: lest it should be said that I was slain by a woman. He did as he was commanded, and slew him.

In verse 53, we have a discourse-new *woman*, reinforced with *ecce*. However, this refers back as a partitive to the plural discourse referent *mulieres*, in verse 51. Therefore, this is an instance of the partitive case. And once again, we have a throw-away referent: this particular referent is not taken up again.¹³

2.2 Slightly less clear cases

The next type of use resembles at first glance the examples we have seen before, although upon closer scrutiny, they may not be identical.

A partitive instance of such a case can be illustrated by the following sequence from Mark 12:38–44, which is the last parable in a lengthy sequence of parables. The main point here is to caution against the scribes who “eat” the widows out of house and home – and very conveniently, in Mark 12:42, a widow comes by, thereby driving home Jesus’s point.

- (15) 38 et dicebat eis in doctrina sua cavete a scribis qui volunt in stolis ambulare et salutari in foro 39 et in primis cathedris sedere in synagogis et primos discutitus in cenis 40 qui devorant domos **viduarum** sub obtentu prolixae orationis hii accipient prolixius iudicium 41 et sedens Iesus contra gazofilacium aspiciebat quomodo turba iactaret aes in gazofilacium et multi divites iactabant multa 42 cum venisset autem **una vidua pauper** misit duo minuta quod est quadrans 43 et convocans discipulos suos ait illis amen dico vobis quoniam *vidua haec pauper* plus omnibus misit qui miserunt in gazofilacium 44 omnes enim ex eo quod abundabat illis miserunt *haec* vero de penuria *sua* omnia quae habuit misit totum victum *suum*
- 38 And he said to them in his doctrine: Beware of the scribes, who love to walk in long robes and to be saluted in the marketplace, 39 And to sit in the first chairs in the synagogues and to have the highest places at suppers: 40 Who devour the houses of widows under the pretence of long prayer. These shall receive greater judgment. 41*

¹³Unless one considers *a femina* in verse 54 to be anaphoric to *una mulier*. However, what king Abimelech takes to be shameful here is not that the action of that particular woman might cost him his life: it is to be killed by *any* women. Therefore, I do not think that *femina* should be interpreted as being anaphoric to *mulier*.

And Jesus sitting over against the treasury, beheld how the people cast money into the treasury. And many that were rich cast in much. 42 And there came a certain poor widow: and she cast in two mites, which make a farthing. 43 And calling his disciples together, he saith to them: Amen I say to you, this poor widow hath cast in more than all they who have cast into the treasury. 44 For all they did cast in of their abundance; but she of her want cast in all she had, even her whole living.

At first glance, this seems to be exactly the same as in (14): *una vidua pauper* has a plural antecedent, namely *viduarum*. However, while one cannot exclude that the occurrence of *viduarum* in verse 40 is to be taken referentially, it does not seem to be necessary to me (it might be a metaphor). If it is not taken referentially, the case for a partitive use is undermined.

The referent introduced by *una vidua* is developed a little bit; but once again, this is not an individual who as such has any importance in the gospel. The widow is used to make a point against the religious establishment of the times. The sequence where the widow appears is outside the warning against the scribes; yet she illustrates the point so well that it has to be taken to be a part of that sequence, and is therefore detached from the main story line.

Besides such (quasi?-)partitives, there are also cases that look like contrastive uses, but which are slightly different from what we have seen so far. In prototypical cases of contrast, we have a repetition of the predicate, or an anaphora to the same predicate. This, however, is not always the case. Let us consider Matthew 8:19–22. The wider context is the following: Jesus has been laboring through a long day of miracle-working and being solicited by all kinds of people. But now, it is evening...

- (16) 19 et accedens **unus scriba** ait illi magister sequar te quocumque ieris 20 et dicit ei Iesus vulpes foveas habent et volucres caeli tabernacula Filius autem hominis non habet ubi caput reclinet 21 alius autem de discipulis eius ait illi Domine permittite me primum ire et sepelire patrem meum 22 Iesus autem ait illi sequere me et dimitte mortuos sepelire mortuos suos
- 19 And a certain scribe came and said to him: Master, I will follow thee whithersoever thou shalt go. 20 And Jesus saith to him: The foxes have holes, and the birds of the air nests; but the Son of man hath not where to lay his head. 21 And another of his disciples said to him: Lord, suffer me first to go and bury my father. 22 But Jesus said to him: Follow me, and let the dead bury their dead.*

In the preceding or subsequent context, there is no mention of another scribe or scribes. Therefore, a partitive use or a contrast with respect to another scribe can be ruled out here. However, there is a contrast with *alius*, even though they do not share the same predicate (scribe vs. disciple). So, this particular instance of *unus* appears unexpected.

However, by declaring his will to follow Jesus, the scribe becomes a disciple of Jesus. The whole sequence would be perfectly as expected if it were analyzed as a pronominal *unus* with *scriba* as apposition – *some guy, a scribe* – which, given the near-total lack of punctuation, cannot be ruled out.

Once again, the scribe is a secondary character, and certainly no protagonist of the gospel, ruling out an analysis as a stage 2 presentative marker.

Summing up, we have discussed here cases that do not correspond perfectly to what we have come to expect from English *one*: i) the distance between the motivating contrast or partitive element may be greater than what is usual today in English, even though the motivating element itself is in principle clear; ii) the motivating element may not be completely obvious in the text, or may depend partially on contextual assumptions. However, given some leeway, I have tried to show that these uses are not that far removed, or can be interpreted in a way that maximizes their conformity with “standard” cardinals.

However, there are cases for which such a strategy seems to have its limits, which we will turn to now.

2.3 Cases without textual antecedent or contrastive element

While many cases seem unproblematic based on the assumed discursive effects of *unus*, some other uses are more difficult to reconcile with the effects we hitherto discussed – notably those that appear at the very beginning of a discourse. Such uses are interesting because they correspond to the prototypical stage 2 uses of Heine (1997).¹⁴

One such case is from 1 Samuel 1:1–3.

- (17) 1 fuit **vir unus** de Ramathaimsophim de monte Ephraim et nomen eius Helcana filius Hieroam filii Heliu filii Thau filii Suph Ephraheus 2 et habuit duas uxores nomen uni Anna et nomen secundae Fenenna fueruntque Fenennae filii Annae autem non erant liberi 3 et ascendebat vir ille de civitate sua statutis diebus ut adoraret et sacrificaret Domino exercituum in Silo erant autem ibi duo filii Heli Ofni et Finees sacerdotes Domini
1 There was a man of Ramathaimsophim, of Mount Ephraim, and his name was Elcana, the son of Jeroham, the son of Eliu, the son of Thohu, the son of Suph, an Ephraimite: 2 And he had two wives, the name of one was Anna, and the name of the other Phenenna. Phenenna had children: but Anna had no children. 3 And this man went up out of his city upon the appointed days, to adore and to offer sacrifice to the Lord of hosts in Silo. And the two sons of Heli, Ophni and Phinees, were there priests of the Lord.

There are no other men mentioned in the text in proximity proximity to *vir unus* (one man), apart from Ophni and Phinees, but these are classified as *filii Heli* – sons of Heli). There are, however, a few other numbered elements: two wives; two sons of Heli, which might legitimate an interpretation as a numeral contrast. Elcana is an important character in this story, because he is the father of Samuel. But what may have triggered the use of *UNUS* here? We are fortunate enough to have a near minimal pair in Job 1:1–3.

(18)

¹⁴As was pointed out by one of the anonymous reviewers, such uses of the cardinal are possible in contemporary English as well: *There was (once) one man...*

1 vir erat in terra Hus nomine Job et erat vir ille simplex et rectus ac timens Deum et recedens a malo 2 natiue sunt ei septem filii et tres filiae 3 et fuit possessio eius septem milia ovium et tria milia camelorum quingenta quoque iuga boum et quingentae asinae ac familia multa nimis eratque vir ille magnus inter omnes Orientales

1 There was a man in the land of Hus, whose name was Job, and that man was simple and upright, and fearing God, and avoiding evil. 2 And there were born to him seven sons and three daughters. 3 And his possession was seven thousand sheep, and three thousand camels, and five hundred yoke of oxen, and five hundred she asses, and a family exceedingly great: and this man was great among all the people of the east.

The only relevant difference concerning the entities introduced at the very beginning of the text is that Job is *the* main character of the book, whereas Elcana is secondary – even though the book starts with him: he is the protagonist’s father. Other than that, there does not seem to be much difference here: it seems extremely unlikely that Job and Elcana were the only men in Hus and Ramathaimsophim, respectively; and in both cases, there are many numerical expressions in the immediate vicinity, which might license a reading of numeral contrast (although not with the same predicate). What one can probably deduce from this contrast is that *unus* was possible in such circumstances, without being obligatory.

Some might be tempted to dismiss these two cases, since they come from the Old Testament, and therefore could be argued to reflect a use of the Hebrew unity cardinal *exad* (‘one’), or its absence.

However, apart from the idea defended in this article that one should read the *Vulgate* as a coherent text, there are also empirical reasons why such cases cannot be dismissed. Indeed, there are occurrences in the New Testament where *unus* appears without a clear antecedent, and therefore, highlight the same problem. Consider Matthew 9:18 (with some context). Here, Jesus returns to his hometown, performing miracles. This attracts considerable attention by all sorts of people, and among the categories introduced into discourse before these verses figure scribes, tax collectors, sinners and Pharisees.

(19) 14 tunc accesserunt ad eum discipuli Iohannis dicentes quare nos et Pharisaei ieiunamus frequenter discipuli autem tui non ieiunant 15 et ait illis Iesus numquid possunt filii sponsi lugere quamdiu cum illis est sponsus venient autem dies cum auferetur ab eis sponsus et tunc ieiunabunt 16 nemo autem inmittit commissuram panni rudis in vestimentum vetus tollit enim plenitudinem eius a vestimento et peior scissura fit 17 neque mittunt vinum novum in utres veteres alioquin rumpuntur utres et vinum effunditur et utres pereunt sed vinum novum in utres novos mittunt et ambo conservantur 18 haec illo loquente ad eos *ecce princeps unus accessit* et adorabat eum dicens filia mea modo defuncta est sed veni inpone manum super eam et vivet

14 Then came to him the disciples of John, saying: Why do we and the Pharisees, fast often, but thy disciples do not fast? 15 And Jesus said to them: Can the children of the bridegroom mourn, as long as the bridegroom is with them? But the days will

come, when the bridegroom shall be taken away from them, and then they shall fast. 16 And nobody putteth a piece of raw cloth unto an old garment. For it taketh away the fulness thereof from the garment, and there is made a greater rent. 17 Neither do they put new wine into old bottles. Otherwise the bottles break, and the wine runneth out, and the bottles perish. But new wine they put into new bottles: and both are preserved. 18 As he was speaking these things unto them, behold a certain ruler came up, and adored him, saying: Lord, my daughter is even now dead; but come, lay thy hand upon her, and she shall live.

There is nothing in the verses following this passage that could motivate the presence of *unus*. Therefore, much hinges on the interpretation of *princeps*: the *New International Version* and other translations render this as *leader of a synagogue* — which should then be a Pharisee, since the Pharisees are the religious movement historically related to synagogues. In this case, it would be a straightforward partitive use. Be that as it may, this is once again a secondary character, and therefore, not one whose textual importance would be expected to be underlined by (what might be) a stage 2 indefinite article.

The most problematic example for a simple adaptation of the discourse behaviour of English *one* seems to be the following instance from Matthew 21:19 (once again from the New Testament), where *unus* lacks an antecedent, as well as a contrast element:

- (20) 18 mane autem revertens in civitatem esuriit 19 et videns fici **arborem unam** secus viam venit ad eam et nihil invenit in ea nisi folia tantum et ait illi numquam ex te fructus nascatur in sempiternum et arefacta est continuo ficulnea
And in the morning, returning into the city, he [Jesus] was hungry. 19 And seeing a certain fig tree by the way side, he came to it and found nothing on it but leaves only. And he saith to it: May no fruit grow on thee henceforward for ever. And immediately the fig tree withered away.

It is not immediately obvious what motivates the occurrence of *unus* here. A partitive is implausible, since the context strongly suggests that this tree was the only fruit tree in the vicinity. There is no contrastive element, either. As far as I have seen, most English translations seem to favor an interpretation along the lines of arbitrariness or lack of importance. However, a paraphrase along “(only) a single” might be fitting here. Such a reading is not easily expressed in contemporary English with the unity cardinal alone, but the use-case can be interpreted as a rather straightforward extension of a cardinal use.

Notice once again that the identity of the fig tree is completely unimportant; it is merely a pretext for a parable. Therefore, it cannot be taken to be an early stage 2 presentative indefinite article. The context in Matthew 21:19 is also one where an English weak *some* would be an appropriate translation, as far as it can convey arbitrariness and lack of importance.

Let us sum up what we have seen so far. In the *Vulgate*, the vast majority of the occurrences of *unus* are straightforward cardinal uses; some uses fit into the familiar

pattern of partitive and contrastive uses, but display a distance between antecedent (or opposing) member and *unus N* that is much greater than what is possible today in English. In rare circumstances, the uses of *unus* do not pattern necessarily with what one would expect from a unity cardinal, but they can be interpreted in ways consistent with what we have seen in English. Let me stress again that none of the referents introduced by *unus* is a particularly important character; most of them are (close to) throw-away references. Under the assumption that the five-stage model by Heine (1997) is correct, and that at the beginning of the process of grammaticalization stands the use of the (proto-)indefinite article with very salient characters in narration, *unus* cannot have become more article-like at this stage in time.

And even if Heine’s model should not be entirely appropriate, given the examples discussed and their similarity to uses of English *one*, there does not seem to be a compelling reason to assume that *unus* is anything other or anything more than a unity cardinal in the *Vulgate*.

3. AN EXPLICIT TREATMENT OF THE DISCURSIVE BEHAVIOUR OF UNITY-CARDINALS

In section 1.2 I gave a brief description of a few salient uses of *one* in English, namely partitive uses, and contrastive uses, and we have also seen that many uses in the *Vulgate* that look at first sight like indefinite articles can be viewed as variations of these uses, if considered in a larger context. The question is how these uses can be accounted for from a formal point of view.

I will argue that unity cardinals trigger antipresuppositions (also known as *implicated presuppositions*, see Percus 2006, Sauerland 2008), extending in particular the ideas of Grønn and Sæbø (2012) and Amsili and Beyssade (2016). I will argue that generally, projective content is a promising way of making sense of the discursive behaviour of these forms.

I will sketch the basic idea for English, and then try to carry it over to Late Latin.

3.1 Extending the game of same and different: projective content and antipresuppositions

My account of the meaning of *one* will extend the work on antipresuppositions by Grønn and Sæbø (2012) on the use of indefinites, and build also on some extensions of their work done by Amsili and Beyssade (2016). I will first present their basic ideas, and then integrate *one* into the framework (which I will assume to be a valid representation also for other unity cardinals, like *unus*).

The basic intuition of this literature concerns the “novelty condition” or effect of non-uniqueness of indefinite articles. This phenomenon is illustrated by the following example, due to Heim (1991: 515f.):

- (21) Richard heard the Beaux-Arts Trio last night and afterwards had a beer ...
- a. ...with the pianist.
 - b. ...with a pianist.

Whereas the definite article in (21a) refers to the pianist of the Beaux-Arts Trio, *a pianist* in (21b) suggests that the pianist was not the one of the trio. The issue with this condition is that it does not seem to hold in all contexts. Antipresupposition approaches to indefinites argue that this is not a basic, semantic feature of the meaning of indefinites, but arises from the fact that it competes in many contexts with a definite article, which contains an explicit presupposition that the entity talked about is already in the common ground (and unique, when we talk about a singular definite).¹⁵

Grønn and Sæbø (2012: 79) define an antipresupposition as follows:

(22) **Antipresupposition**

When you have a choice between two forms α and β differing only in a presupposition π , triggered by α but not by β , if the context supports π , you are to choose α . Thus, when you use β , this will signal the opposite: π is not supported by the context.

I will use the following representations of indefinite and definite articles based on Grønn and Sæbø (2012) and Amsili and Beyssade (2016)¹⁶, using a flat DRT notation based on Sauerland (2008), where the numerator indicates the presupposition, and the denominator the assertive content:

$$(23) \quad a \mapsto \lambda P \lambda Q \lambda w \frac{|}{x | P_w(x), Q_w(x)}$$

$$(24) \quad \text{the} \mapsto \lambda P \lambda Q \lambda w \frac{z | P_w(z), \text{card}(P_w) = 1}{x | P_w(x), Q_w(x), x = z}$$

The indefinite article is assumed to contain no presupposition, whereas the definite contains the presupposition that there is already an entity satisfying the same predicate P in the context, and that the cardinality of the predicate in the context corresponds to 1. Furthermore, the definite article imposes in its assertive content an identity condition on the new discourse referent, making it identical to the already present entity, which is not the case for an indefinite.

¹⁵The distribution of indefinite articles is highly complex, and I cannot begin to do justice to the literature. For extensive discussion, see Hawkins (1991).

¹⁶(23) is directly from Grønn and Sæbø (2012: 82); the representation in (24) is taken from Amsili and Beyssade (2016: 13), who propose to amend the definition by Grønn and Sæbø (2012) (given in (i) below) by explicitly incorporating a unicity presupposition.

(i) $\text{the} \mapsto \lambda P \lambda Q \lambda w \frac{z | P_w(z)}{x | P_w(x), Q_w(x), x = z}$

Grønn and Sæbø do not deal with plural definites in their article, but once they are taken into consideration as alternatives, it will be necessary to include some sort of unicity presupposition in order to account for presupposition failures when trying to refer to a plural antecedent with a singular definite DP. Amsili and Beyssade (2016) provide a formalization that meets this objective.

What these representations ensure is that *a* and *the* form a Horn-scale, where *the* is a stronger alternative than *a* – which is indeed desirable, given their use in contexts like *not just a N, but the N*:

(25) These girls are looking for not just a guy, but the guy. COCA Corpus

Therefore, the argument goes, if *a* is in competition with *the* – which is not the case in all contexts –, one will get antipresuppositions of novelty and non-uniqueness.

Grønn and Sæbø (2012) propose that another element may impact the distribution of the indefinite article, namely *another*, represented as in (26).¹⁷

$$(26) \quad \text{another} \mapsto \lambda P \lambda Q \lambda w \frac{z | P_w(z)}{x | P_w(x), Q_w(x), x \neq z}$$

Another contains a presupposition that there is already an entity of predicate *P* in the context, and asserts that the new discourse referent is different from that entity. Once again, *another* is strictly more informative than *a*, and so in cases where *a* is in competition with *another*, the use of *a* should license the inference that the newly introduced entity is identical to the one already existing in the common ground. Grønn and Sæbø (2012: 85) argue that in cases where the speaker is assumed to have sufficient relevant knowledge, and if both *the* and *another* are competitors, the use of the indefinite article is infelicitous.

Let us now introduce *one* into this comparative endeavour, this game of same and different. I will assume the following representation for *one*:

$$(27) \quad \text{one} \mapsto \lambda P \lambda Q \lambda w \frac{|}{x | P_w(x), Q_w(x), \text{card}(P_w \cap Q_w) = 1}$$

The representation in (27) thus assumes that *one* has no presuppositions, and that it contains a cardinality condition ($\text{card}(P_w \cap Q_w) = 1$), which is the only element distinguishing it from the indefinite article.

Let us walk through this, and justify some aspects of this formalization. Notice first, that *a*, *the*, and *one* (as well as *another*) assert the existence of an entity of type *P*:

- (28) a. John saw the rabbit.
 b. John saw a rabbit.
 c. John saw one rabbit.

All of (28) entail that *there exists a rabbit*. And (28a) and (28c) have a uniqueness entailment: there is only one rabbit (such that they saw it). This is the familiar uniqueness-presupposition in the case of (28a), but in the case of (28c), this seems to work differently: it is compatible without any problem with the existence of several rabbits in the context (see (29a) vs. (29b)).

¹⁷Amsili and Beyssade (2016) propose a compositional account of *another* (as *a(n) + other*) and *the other*, but I will not concern myself with this.

- (29) Bugs and Bunny are both rabbits, ...
a. and John saw one rabbit.
b. #and John saw the rabbit.

Since *the* according to (24) requires unicity only with respect to its nominal predicate (here *rabbit*), (29b) is predicted to fail because of the contradiction with the presupposition; (29a) is predicted to be felicitous because unicity here depends not only on being a rabbit, but also on being seen by John.

Concerning the cardinality condition, Crisma (2015: 146) observed that *one* does not behave like other cardinals, which have a “soft”, implicated upper boundary.

- (30) a. John saw two rabbits; in fact, maybe he even saw three.
b. John saw one rabbit; #in fact, maybe he even saw two.
c. John saw a rabbit; in fact, maybe he even saw two.

One explanation for the pattern in (30) could be that *one* necessarily has a focus on the unity cardinal, since it has an (unfocused) a clitic alternative (namely the indefinite article). However, this does not seem to be the whole story, since in embedded contexts, the focus may fall on either ‘one’ or on the noun:

- (31) a. I’m sure that John saw [ONE]_F rabbit; #in fact he maybe even saw two.
b. I’m sure that John saw one [RABBIT]_F; #in fact he maybe even saw two.

(31a) is infelicitous, as expected, but even (31b) does not allow for the continuation, even though the focus sensitivity operator is associated with the common noun here.¹⁸

Notice that the definite article seems to behave more like the indefinite article than the unity cardinal, as it allows the continuation in (32). It does not seem to block reference to elements that are not (as of yet) in the common ground the way ‘one’ does.:

- (32) John saw the rabbit; in fact, maybe he even saw two rabbits.

Furthermore, even though according to this formalization, *one* should entail *a*, there is probably no scale associated with the opposition between *a* and *one*, as is indicated by the infelicity of (33):

- (33) ?*These girls are looking for not just a guy, but one guy.

¹⁸As pointed out by Igor Yanovich (p.c.), (31b) might be infelicitous simply because the contrast given in the second clause does not match the focus structure in the first clause. However, if the focus on *rabbit* is motivated by a contrast with the preceding context, the issue still remains:

- (i) a. Wait a minute – did John see one rabbit or one naked mole-rat?
b. I’m sure that John saw one [RABBIT]_F; #in fact he maybe even saw two.

However, the opposition is nevertheless meaningful in some contexts, and substituting one for the other can lead to strange effects.

- (34)
- a. John has a nose.
 - b. ?*John has the nose.
 - c. ?John has one nose.
 - d. ?John has one nose, and Jill has another.

As has been known at least since Hawkins (1991), in contexts like (34a), with an inalienable possession below *have*, definite articles are infelicitous, as is illustrated in (34b). Therefore, they are no alternatives here. However, even though humans prototypically have unique noses, one still cannot say so and use the unity cardinal when talking about inalienable possession. Even adding a contrastive element (i.e., Jill’s nose, as in (34d)) does not make things better. Intuitively, what makes (34c) strange is that it suggests that John *might* have more than a single nose – which is not possible under cases of inalienable possession and standard human anatomy. This is probably best explained as follows: in using *one* where the indefinite would have been appropriate, the additional effort (or use of the less frequent item) must be somehow motivated (and this will thus give rise to a manner implicature). This motivation then makes scalar alternatives to *one* (that is, other cardinals) salient.

Indeed, even though *one* does not seem to be on a scale with *a*, it is a member of scales involving cardinals, or imprecise cardinal expressions (like *several*, or *many*):

- (35)
- a. I recommended to the Secretary of the Navy that he constitute a new board, not just one officer, but several officers. COCA Corpus
 - b. You must think, not just one step, but two steps ahead and be prepared to abandon your best made plans [...]. COCA Corpus

The observation here is that, even though – according to the present formalization – *one* should be able to form a semantic scale with *a*, it is not located at the same level of grammatical saliency in English as the definite and indefinite articles: *one* clearly is a second-tier determiner, which has much lower frequency than the articles.¹⁹ Therefore, there is at least a frequency effect underlying (or influencing) the range of possible choices.²⁰

Let us now come back to the standard cases in which *one* is used in English, and consider first the partitive use. In such a context, we have a plural antecedent in the common ground, and we want to assert something with respect to a single entity out of this plural antecedent. Clearly, in such a case, the definite article is infelicitous,

¹⁹According to the word count using all the books archived in *Project Gutenberg* given in <http://1.101.in/semanticdepth/freq100000.pdf>, *the* is the most frequent word in English, while *a* is the 5th most frequent. *One* is the 39th most common word in this corpus, and while all uses of *the* and *a* are determiner uses, *one* has pronominal and other non-determiner uses as well.

²⁰Geurts (2011) introduces the notion of the *availability* of alternatives. A much more frequent expression with overlapping meaning should count as available.

because its presupposition fails when combined with a singular, and the assertion fails when combined with a plural. The question is, how could we account for the infelicity of the indefinite article? Competition with *another* should not be an issue here, since the new entity is part of the given entity. Grønn and Sæbø (2012: 86) suggest for a slightly different case (with a singular antecedent), that the indefinite is blocked because it is a clitic: with a plural N as antecedent, the singular N has to be deaccented (since it is given), and because the indefinite article is a clitic, it cannot receive an accent, either. Hence, *a* is blocked, and we need something that can be accented, and has a meaning that is similar enough. *One* is a possible candidate, and is therefore used instead of the indefinite.²¹

Second, the same type of reasoning obtains when we have the familiar opposition of *one* (*N*) with *another* (*N*). In these cases as well, if the speaker wishes to mark contrast, the noun will be deaccented, since this contrast will not involve the (identical) predicate. Therefore, this situation requires a determiner which is not a clitic (which therefore excludes the articles *the* and *a*, whose accented versions can only be used metalinguistically). If the entity is not already discourse-old, *one* is then the only article that fits the bill.²²

Numeral contrast can also be explained by the assumed semantics, since *one* is the only one of the considered determiners which has a cardinality specification as an *asserted* content (contrary to the definite determiner, which may have a cardinality

²¹This explanatory strategy needs to be further worked out, and might ideally integrate the distinction between accent and stress (see, e.g., Büring 2016: chapters 6–7). However, it seems to me that – whatever the correct explanation turns out to be – it cannot be based on the semantic content of the items involved, because I do not see how one could exclude the indefinite article on such grounds. The partitive context can be formalized as follows:

$$(i) \quad \frac{X|P(X)}{z|P(z), Q(z), z \in X}$$

Notice that semantically, *a* is fully compatible with the context in (i); there is conflict in neither presupposition nor assertion. Because of presupposition failure, the singular definite article is no competitor; and if the competition were between the indefinite article and *another*, *a* should by antipresupposition have a non-novelty effect. And being singular and non-novel could only correspond to the partitive condition. But the fact is that the indefinite article is infelicitous in these contexts. Therefore, either the meaning assumed here for *a* is incorrect, or its infelicity is not related to its meaning, but to some other property. Given the quantity of literature on the indefinite article, it is more prudent to assume the latter.

Another strategy to explain the unavailability of the indefinite article would be to resort to a manner implicature arising from the competition between the unmarked bare singular, and the marked unity cardinal, and for contexts that would oppose the more frequent contexts of introducing a new discourse variable in an empty context, as opposed to the less frequent partitive contexts. A worked-out analysis along these lines will be proposed in Schaden (to appear).

²²As has been noted by Beyssade (2017: 66f.), rhetorical relations also have an impact on the admissibility of anti-presupposition triggers (which may be related to intonational patterns: ENUMERATION, PARALLEL and CONTRAST all can be seen to involve contrastive topics).

specification as a presupposed, not at-issue content). The indefinite article has no intrinsic cardinal component to it, even though it will most often denotationally correspond to a cardinality of 1. Finally, there is also the effect of intonation to observe, as is illustrated in (36):

- (36) a. Marc bought one bottle, and Brett bought three bottles.
 b. ?*Marc bought a bottle, and Brett bought three bottles.
 c. Marc bought a bottle, and Brett bought a keg.
 d. Marc bought a bottle, and Brett bought three kegs.

When the contrast is on the predicate as in (36c–d), the indefinite article is felicitous, even if the numbers are different. However, if the predicate is the same and the quantity different, the unity cardinal is obligatory, and the indefinite article infelicitous. This must be due to the contrastive stress on the determiners, which cannot be carried by a clitic like *a*.

So, should this kind of reasoning be correct – which is a conservative extension of the work of Grønn and Sæbø (2012) and Amsili and Beyssade (2016) –, the reason *one* is used in a number of contexts instead of the indefinite article is mainly because it can be accented, while still being sufficiently close in meaning to the article. Indeed, in many contexts, an indefinite article will also imply that there is no plural entity, which is why the additional meaning of *one* is not a handicap.

3.2 UNUS in Latin: Alternatives and effects

Let us now go back to the *Vulgate*. We have seen in section 2 that the patterns seen with *unus* are close, though not completely identical, to what we observe in English. Assuming, furthermore, that the linguistic phenomenon distinguishing the use of the unity cardinal and the indefinite determiner has been correctly identified as antipresupposition, it is important to know what the alternatives to *unus* were in the Latin of the *Vulgate*. The major difference between English and Latin is that the latter had no articles, and that singular bare nouns covered the use cases of both definite and indefinite articles in contemporary English. This can be illustrated by example (14), repeated below as (37).

- (37) 51 erat autem **turr̄is** excelsa in media civitate ad quam confugerant viri simul ac mulieres et omnes principes civitatis clausa firmissime ianua et super **turr̄is** tectum stantes per propugnacula 52 accedensque Abimelech iuxta **turrem** pugnabat fortiter et adpropinquans ostio ignem subponere nitebatur
 51 And there was in the midst of the city a high tower, to which both the men and the women were fled together, and all the princes of the city, and having shut and strongly barred the gate, they stood upon the battlements of the tower to defend themselves.
 52 And Abimelech, coming near the tower, fought stoutly: and, approaching to the gate, endeavoured to set fire to it

If we look at the occurrences of *turr̄is* (‘tower’) in example (37), we see that it appears without any explicit marking. The first occurrence, where *turr̄is* is discourse

new, is however marked in current English by an indefinite, and the two subsequent occurrences by a definite article, as can be seen in the translation.

Therefore, the major alternative to *unus*, given the assumption – as above – that unity cardinals have an existential entailment, was the singular bare form. Another possible competitor is *ille N*, which is the diachronic source of most of the definite articles in Romance.

What precise meaning should we assume for these entities? I suggest that the meaning of *unus* is identical to the meaning of *one* in English, and that the meaning of a bare singular corresponds to a NP with an indefinite article in English:

$$(38) \quad \text{unus} = \text{one} \mapsto \lambda P \lambda Q \lambda w \frac{\lambda x | P_w(x), Q_w(x), \text{card}(P_w \cap Q_w) = 1}{|}$$

$$(39) \quad \emptyset = \text{a} \mapsto \lambda P \lambda Q \lambda w \frac{\lambda x | P_w(x), Q_w(x)}{|}$$

It is important to notice that semantically, the representation in (39) is perfectly compatible with both definite and indefinite uses as illustrated in (37); it merely does not require its uses to be one or the other.

I will justify the representations in (38)–(39) shortly, but let me first say a word about *ille*. *Ille*, like *unus*, has pronominal and adnominal uses, and appears 1498 times in the New, and 3097 times in the Old Testament. Among these occurrences, 241 attestations in the New Testament, and 154 in the Old Testament, are adnominal.²³ *Unus* appears 298 times in the New Testament, and 723 times in the Old Testament, of which respectively 121 and 432 are adnominal.²⁴ While the global frequency of *ille* is therefore roughly four times higher than that of *unus*, their adnominal uses are comparatively frequent. I therefore do not take *ille* to be a direct competitor to the bare nominal option (as a definite determiner would be), but rather to still be a demonstrative (which may be a competitor in a few, very circumscribed cases).²⁵

I will therefore assume that in Latin a bare noun is always available and salient, and that the use of *unus* has to be understood with respect to such a background. The explanations for the use of *unus* in Latin are thus basically the same as what we have already given for *one* in English, with the difference that there is no dedicated definite determiner, and there are no articles in general. Let us walk this through for

²³The count has been established as follows: I extracted all verses containing *ille*, which I then tagged with *treetagger* (see Schmid 1994), using Marco Passarotti’s Latin parameter file, via Laurent Pointal’s *treetaggerwrapper*-library for python. I counted as adnominal all cases where a form of *ille* was congruent to a noun within a window of three words before and three words after *ille*. This method of counting overestimates adnominal uses at least slightly.

²⁴This count was done by hand, and is therefore more reliable than the count of *ille*.

²⁵If *ille* were a competitor to *unus* and/or the bare singular, this would influence the expected anti-presuppositions of *unus* and the bare singular, and, therefore, their respective distributions. This has undesirable effects especially for the bare singular, which would then be predicted not to appear in any case where *ille* is felicitous – which would therefore exclude many simili-definite uses.

should pattern with Latin against English. The exploration of this issue must be left to further research.

4. TOWARDS AN EXPLANATION OF THE FIRST STEPS IN GRAMMATICALIZATION

My basic assumption is that an indefinite article is a unity cardinal that is used very often (and eventually may become obligatory in some contexts). During this process of becoming obligatory, it may diverge in its form from the cardinal (which occurred in English, and some varieties of German, but not in Romance languages). Given these assumptions, three basic questions are in need of an answer: i) what meaning change does this increase in use require? ii) why should the rate of use of the unity cardinal increase?; and iii) how is this increase related to the phonetic erosion of the unity cardinal?²⁷

The important background to note is the following: under the assumptions we have made in this article, even though a unity cardinal comes with strictly more meaning than a bare form (or than an indefinite article, in languages that have one), given standard use cases for those forms, it will rarely be the case that the context makes the use of the cardinal inappropriate or even false. Most of the time, its use will constitute more signaling effort than is strictly necessary. Such cases of unclear motivation are attested in the use of *unus* vs. the bare version, as in (close-to) minimal pairs like the following:

- (41) a. latitudo [habebat] cubitum et dimidium Exodus 25:10
width.NOM had cubit.ACC and half.ACC
'It [the ark of the covenant] has a width of a cubit and a half.'
- b. pariter=que habebat unum cubitum et dimidium
similarly=and had UNUS.ACC cubit.ACC and half.ACC
'And similarly it measured one cubit and a half.' 1 Kings 7:31

It should be clear that there is no truth-conditional difference between the two versions in (41); however, there does not seem anything fundamentally wrong with employing the unity cardinal.²⁸

On the other hand, there will also be few contexts which would require the *meaning* of a bare singular (or an indefinite article), as opposed to the meaning of the unity cardinal. For instance, there is nothing wrong in principle in using a unity cardinal in a predication context (although it has some effects we will discuss in section 4.2 below):

- (42) 'Rampage' is one stupid ass movie.²⁹

²⁷This step is arguably optional, as illustrated by Romance languages.

²⁸One gets similar effects in measure phrases in contemporary English; in the COCA corpus (compiled by Davies 2008–), a search for *an inch* yields 4171 results, whereas *one inch* yields 471 hits.

²⁹This is the beginning of the (not entirely negative) review; there is no reference to other movies in the whole text. And sure enough, for all the bad things one might say about *Rampage*,

Similarly, the existence of plural forms is not incompatible with a cardinal interpretation. Notice that many unity cardinals do allow for plurals (think of English *ones*), and that, if the semantics for unity cardinals proposed in Schaden (to appear) is correct, there is indeed nothing in the meaning of a unity cardinal that would be intrinsically incompatible with pluralization. Therefore, the presence of a plural form of a unity cardinal is not *ipso facto* an indicator of a highly advanced indefinite article.³⁰

Thus, the major checks on the frequency of the unity cardinal are not the intrinsic meaning of the unity cardinal nor the contexts in which it appears, but rather speaker effort and the effect a speaker wants to obtain by choosing a more elaborate signal.

That being said, let us address the three questions.

4.1 Meaning change: weakening the hard upper bound

If the results of this article are to be trusted, *one N* is only distinct from the indefinite article by having a cardinality meaning attached to it, and it triggers antipresuppositions which make it apt to appear in partitive and contrastive environments, which depend crucially on its not being a clitic. Obviously, both the antipresuppositions and the cardinality component no longer arise in the same way with an indefinite article like the contemporary English *a*. Remember also from (30) that the cardinal meaning of unity cardinals is special in that it has a hard upper bound, and not a soft upper bound like all other cardinals.

Let us fast forward a few centuries. Carlier (2001 2013) observes that Latin *unus* in a restrictive sense (that is, uses roughly conveying ‘a single N’) is translated in Old French generally by *uns*, whereas from the Middle French period on, there generally is a additional restriction (\approx ‘only’) added to it:³¹

- (43) a. una=ne pecunia fuerit
one.NOM.SG.F=Q sum.NOM.SG. be.PFCT.FUT.3SG
 ‘Has there been **one sum**?’
 b. Fu ele une pecune?
be.PST.3PL she one/a.F.SG sum?
 ‘Has there been **one sum**?’
 c. N’ y a-t-il eu qu’ une somme?
RESTR LOC have.PFCT.3SG RESTR one/a.F.SG sum?
 ‘Has there been *only one sum*?’

This change in translation is clearly significant, but there are two possible ways to interpret it. Carlier (2013: 47) takes additional restrictors to indicate that *un* is no longer

it is a movie, and its cardinality is one. Source: <http://redcarpetcrash.com/movie-review-rampage-is-a-disaster-for-better-and-worse/>, retrieved on 10/10/2018.

³⁰It has been observed that in languages like French or Spanish (see Carlier 2013, Pozas Loyo 2010), plural forms of *unus* appear relatively early, much earlier than predicted by the scale by Heine, even though it is not obvious how this fact should be interpreted.

³¹The examples in (43) are taken, with their glosses, from Carlier (2013: 47). The Latin original is from Cicero, *De Inventione II*, 64. The translation in (43b) is from J. d’Antioch (1282, LI), whereas (43c) comes from a 20th century translation by Bornecque.

a cardinal. Her reasoning goes as follows: in Old French, where the numeral value was still dominant, the translators felt no need to add a restriction, whereas in more recent varieties of French, where we can assume *un* to be an indefinite article, there is a need for adding such a restriction, in order to obtain a cardinality interpretation. Therefore, the presence of a restriction is an indicator of a loss of cardinality status and meaning, in a two-step process from cardinal to indefinite article. However, this does not necessarily follow. A second, and by far more conservative interpretation of the same facts (under the assumption of a gradual transition from “hard upper bound cardinal” to indefinite article) is that the rising frequency of restrictors simply indicates that the upper bound constraint was softened, and that the unity cardinal aligned with other cardinals (thus, that the uses of *one* vs. *only one* exactly parallels, e.g., the use of *two* vs. *only two*), and does not indicate a complete loss of cardinal status. The basic issue here is that we have (at least) a three-step transition, from hard upper bound cardinal to soft upper bound cardinal, and then from soft upper bound cardinal to indefinite article.

How can we explain the disappearance of the hard upper bound? Unless one assumes that unity cardinals are fundamentally different from all other cardinals, this is likely due to an antipresupposition in languages which have a singular-plural system, since the unity cardinal has a competitor in the singular bare noun or indefinite article which all other cardinals lack.³² Therefore, if the unity cardinal is chosen over the default (bare or indefinite article), which also signals a singular entity, this may signal higher confidence, and the ‘exactly’ interpretation will arise, and the hard upper bound will be derived.

However, once the use of the cardinal becomes more frequent, and a hearer no longer expects the use of the alternative form, the hard upper bound disappears, and the unity cardinal aligns with other cardinals in obtaining a soft upper bound.

4.2 The Increase in frequency

Now, let us get back to the first question: why should the frequency of use of a unity cardinal rise in the first place?

When looking at examples like (41b) or (42), it seems probable that *emphasis* has a role to play: even in the absence of a clear truth-conditional difference, if there is emphasis, the unity cardinal is used; without emphasis, the alternative (bare noun or indefinite article) is used. It may appear that the notion of emphasis is a poor choice underlying a formal model of language change, but Ahern and Clark (2017) have already worked out a model explaining such a process for Jespersen’s cycle. The function of emphasis in Ahern and Clark (2017: 8ff.) is that emphasis sharpens a standard of evidence, and that using an emphatic element signals that the speaker has better evidence than normal for the assertion. Carrying over this idea to our examples would mean that a speaker calling *Rampage* ‘one stupid-ass movie’ rather than ‘a stupid-ass movie’ indicates a higher degree of confidence and evidence with

³²Should this explanation be on the right track, it predicts that in a language with a fully functional dual, the cardinal ‘two’ should similarly have a hard upper bound.

respect to the judgment. Similarly, for (41b), the idea is that a speaker asserting ‘*one cubit*’ signals higher precision and evidence than signaling simply the bare ‘*cubit*’.³³ Whether the case at hand meets a high enough standard of evidence to warrant an explanation based on emphasis must be left for further investigation.

The increase of the emphatic form (in our case, the unity cardinal, as opposed to the non-emphatic bare form) can then be explained as an inflation process – which is a rather standard way of conceiving the dependence between meaning and frequency.³⁴ In a nutshell, the idea can be stated as follows: in having an emphatic and a non-emphatic form, there will be a partition of degrees of emphasis involved in an assertion: below some threshold x , the bare form will be used, whereas above this threshold, the unity cardinal will be used. Therefore, signaling emphasis provides for a rhetorical effect, which a hearer reacts to.³⁵ However, speakers are assumed to have a bias which drives the threshold down over time, such that the rhetorical effect is more and more diminished.³⁶ Eventually, this will lead to the disappearance of the non-emphatic, bare variant, and the optional unity cardinal will have become an obligatory indefinite article.³⁷

4.3 Phonetic erosion and scope issues

Finally, let us come to the problem of phonetic erosion. As I have pointed out, this is not a necessary process, but one can make a case that in languages like German or in Romance languages, the indefinite article is a clitic version of the cardinal. The old form can, however, still be used as a cardinal. How can this be accounted for?

Part of the answer to this question is related to some rather puzzling facts about scope dependencies. As we have seen, unity cardinals can appear without any problem within the scope of a quantifier. However, according to the standard classification of Heine (1997), narrow scope readings disappear in the development of the indefinite article. This seems somewhat paradoxical if one is not willing to assume that a form acquiring a new meaning will necessarily lose the old meaning. I will take the

³³There is actually evidence that this holds for English. Remember from footnote 28 that in COCA, the proportion of *one inch* as opposed to *an inch* is roughly 1:10. However, if we look at their combination with approximators, this proportion shifts considerably: *an inch or so* yields 155 hits in COCA, whereas *one inch or so* is a hapax. Therefore, there is reason to believe that in the minds of English speakers, a use of *one inch* is more precise a measure than a use of *an inch*.

³⁴Similar ‘inflation models’ of linguistic change, but less formalized and worked out, have been proposed by Dahl (2001) and Schaden (2012).

³⁵For details, see Ahern and Clark (2017: 12).

³⁶There are different ideas about what that bias may be; see Schaden (2012) and Ahern and Clark (2017) for relevant ideas.

³⁷One of the general weak points of such inflation-based accounts is that one would expect the force causing inflation to be active across all languages, whereas all languages do not develop an indefinite article (or else remain stationary at some point of the development). This remark is not only valid for the present sketch of the development of the indefinite article; it also applies to the better worked-out examples of inflation such as the present perfects and negation.

position here that what is at stake is not the specific vs nonspecific readings, but actually the issue of the unity cardinal occurring under the scope of another scope-bearing element (be that a modal, or an adnominal universal quantifier).

Note that the narrow scope indefinite configuration (henceforth $\bullet\exists$) is an unmarked configuration with respect to the wide-scope configuration (henceforth $\exists\bullet$), in the sense that the latter is strictly more informative than, and constitutes a special case of, the former.³⁸ Consider (44):

- (44) Every citizen worships a god.
- a. Narrow scope: For every citizen x : there exists a god y such that x worships y
 - b. Wide scope: There exists a god y such that, for every citizen x , it is true that x worships y .

Whenever (44b) is true, then (44a) will also be true; however, if (44a) is true, it might still be the case that (44b) is false (say, if I worship Isis, and you worship Mithras). Therefore, (44b) asymmetrically entails (44a), and we have a Horn-scale between these two meanings, where $\bullet\exists$ is the weak term (unmarked), and $\exists\bullet$ the strong (marked) term.

It has often been observed that marked forms tend to associate with marked meanings, and that unmarked forms associate with unmarked meanings (a phenomenon known as the DIVISION OF PRAGMATIC LABOR, see, e.g., Horn 1989: 197f.). Therefore, associating a marked form (that is, *unus N*) to the marked meaning $\exists\bullet$ and the unmarked form (that is, the bare noun) with the unmarked meaning $\bullet\exists$ would be the expected outcome, and form a so-called Horn-strategy, whereas associating the unmarked bare form with the marked meaning (and vice versa) would correspond to an Anti-Horn strategy (see, e.g., van Rooy 2004). Let us see how we can derive this in the framework we have been using so far.

Notice first that using a definite article in order to signal wide scope would not only correspond to $\exists\bullet$, but require the entity having wide scope to be presuppositional. *Another*, comparatively, would require that all elements in the discourse be different (see Grønn and Sæbø 2012: 90). Therefore, both of these forms can be excluded as candidates in potentially marking scope ambiguities. So, in case of a narrow-scope configuration, the most unmarked remaining form should be used, which is the bare form. On the other hand, in the case of a non discourse-linked wide-scope configuration, if this is deemed to be important enough to be marked, we should then reach for some marked form with a sufficiently compatible meaning. Once again, the unity cardinal is a plausible candidate for this use.

This prediction has, however, a loophole, allowing for a narrow-scope interpretation of the unity cardinal in one context. There is a second configuration which is asymmetrically entailed by $\bullet\exists$, namely if there is some importance to the fact that

³⁸As pointed out by Igor Yanovich (p.c.), this argument requires \bullet to not be a negation (since $\exists x\neg P(x) \not\models \neg\exists xP(x)$); as far as I can see, \bullet can be any strong quantifier or modal operator.

not only the relation is $\bullet\exists$, but also, that the cardinality of each dependent element is exactly *one*.

(45) For each citizen x , there is exactly one god y such that x worships y .

Once again, whenever (45) is true, then (44a) will also be true, but (44a) being true does not require (45) to be true (say, if you worship Mithras alone, but I worship Isis *and* Serapis). Therefore, there is a second Horn-strategy available.

If the use of Horn-strategies to explain scope dependencies is on the right track, this gives us the following empirical prediction: in the beginning stages of grammaticalization, if a unity cardinal is used, the speaker should target a marked interpretation. That is, we should not observe narrow-scope readings of a unity-cardinal, unless we have a restrictive meaning, in the sense of *only one N*. Should such narrow-scope readings be present, this would falsify the Horn-strategy explanation.

Notice, however, that there is a well-known descriptive generalization in the grammaticalization framework that lends support to the Horn-strategy hypothesis. We have the impression that, at some stage in its diachronic development (that is, stages 2–3 in Heine’s scale), an indefinite article loses the possibility of taking narrow scope. Marking wide scope by means of a unity cardinal is just one way of giving a marked form a marked reading. However, the cardinality component of a unity cardinal is not causally related to the wide-scope reading (although it does nothing to impede it). Yet, in case of a narrow-scope reading insisting on the cardinality *one*, the semantic difference between the bare form and the unity cardinal is stressed. This would also mean that one should expect the determiner in the narrow scope context to always be accented, and therefore be perceived as the numeral (and it should not be able to undergo phonetic erosion in this context). Since the wide-scope marking does not intrinsically depend on any meaning component of the cardinal, one would not expect it to be systematically accented, and therefore it should be more susceptible to phonetic erosion in this use. In the long run, this could then lead to a dissociation between a cardinal (which is always accented) and an indefinite article (which is not).

Let me sum up the core idea defended in this section: there are very few contexts which would *semantically* require or prohibit a unity cardinal (as opposed to a bare singular, or an indefinite article), so its use comes down to whether the speaker is motivated to use a more marked form where it is possible but not strictly necessary. The motivation for use of the unity cardinal has been tentatively identified as *emphasis*, of which [Ahern and Clark \(2017\)](#) have provided a formalization. I have also introduced an explanation of how use can erode this emphasis. I have tried to demonstrate how the avoidance of indefinite articles in narrow-scope contexts can come about, and how this can also give us a clue about the diachronic process of the separation of a single form into two different forms (unity cardinal vs. indefinite article). While these ideas are still speculative, they provide a starting point from which a fully formal pragmatic and usage-based account of the extension of the use of unity cardinals can be explored, and where fully formal diachronic models of language change can be applied.

5. CONCLUSIONS AND PERSPECTIVES

In the present article, I have tried to complement the existing literature on the grammaticalization of indefinite articles by describing the discourse behaviour of unity cardinals in English and Latin. I have argued that this is a necessary endeavour because – while we have a good idea of the semantics of the indefinite article in languages like English (which is close to the diachronic endpoint of the grammaticalization process), and we also have a general understanding of the vector of change – the discourse behaviour of unity cardinals has so far not been investigated in sufficient detail. Therefore, we lack a solid baseline from which we can judge further developments. I have provided a formal account of the distribution of these cardinals based on the work by [Grønn and Sæbø \(2012\)](#) and [Amsili and Beyssade \(2016\)](#). Empirically, I have tried to show that ‘innovative’ uses of *unus* in the *Vulgate* correspond quite closely to standard uses of unity cardinals, which I have taken to be exemplified by English *one*. Therefore, I have concluded that – for the Latin of the *Vulgate* – there is no need to assume that any kind of grammaticalization process has taken place. I have also tried to sketch by which pragmatic procedures the early stages of grammaticalization can be explained.

Contrary to most preceding analyses, but in line with [Pozas Loyo \(2010\)](#), this account makes little use of *semantic* changes in a strict sense, at least for the initial stages of grammaticalization, but stresses factors such as the ability to be accented as important for the diachronic development of unity cardinals. Therefore, it is more in line with inflation-based approaches to language change like [Schaden \(2012\)](#) and [Ahern and Clark \(2017\)](#), and may open the analysis of the diachronic development of indefinite articles in this direction.

A NOTE ON METHODOLOGY: THE *VULGATE* AS A SACRED, AND TRANSLATED TEXT

This article has examined the use of *unus* in the *Vulgate* in its own right, and as a genuine (late) Latin phenomenon. Yet, to what degree does the use of *unus* in the *Vulgate* represent an actual Latin usage, or does it rather reflect a phenomenon of the source languages (or texts)? This is an extremely difficult question to answer in a general way (see, e.g., [Calboli 2009](#) and [Rubio 2009](#) for the more general question of the influence of Greek and Semitic languages on Latin), but the existing literature provides some answers.

A first potential worry stems from the fact that the *Vulgate* is a translated work. Since it is additionally an example of a holy (and divinely-inspired) text, a translator might be tempted even more to calque features from the source text that do not correspond closely to the target language’s grammar. However, unlike other translations (e.g., into Syriac, where lost Greek originals can be reconstructed from the Syriac version), Latin translations are no word-by-word renderings of their Greek source text (see [Houghton 2016](#): 143ff. on this issue).

A second problem concerns the source language of the translation. While for the New Testament, it is necessarily Greek, it is not that clear that the unique source for the Old Testament is Hebrew (and, to a lesser degree, Aramaic): Jerome’s fluency in Hebrew has often been questioned (see [Newman 2016](#)), and it is certainly the case that he was familiar with the (Greek) Septuagint version of the Old Testament before he knew the Hebrew original.

And even with respect to the New Testament, Jerome did not start from scratch: there were several preexisting Latin translations, collectively known as the *Vetus Latina* (for a description of the different manuscripts and their textual relations, see, e.g., [Burton 2013](#), [Houghton 2016](#)).

Finally, there is also variation in the Greek source texts themselves, which have been classified into several “text types” (see [Metzger and Ehrman 2005](#): 276ff.), even though the well-foundedness of these types has been called into question recently (see, e.g., [Burton 2013](#), [Houghton 2016](#)). The important point here is that Greek sources also vary with respect to the use of *heîs* (which is the Greek unity cardinal *one*). The edition of the Greek New Testament in PROIEL (see [Haug and Jøndal 2008](#)) is based on recent critical editions of the Bible (see [Aland et al. 2012](#)), whereas the Greek Orthodox Church liturgy uses a different recension (manuscripts in this tradition form the “Byzantine text type”), which is also the base of Erasmus’s *Textus Receptus* (see [Metzger and Ehrman 2005](#): 276–280). The Greek Orthodox majority text shows a *heîs* in a few passages, where other recensions lack it.³⁹

As an illustration, consider the following versions of the beginning of John 6:9, where (46a) is transliterated from [Aland et al. \(2012\)](#), whereas (46b) is transliterated from [Hodges and Farstad \(1985: 308\)](#), and where (46c) is from the *Vulgate*:

- (46) a. estin paidarion hōde hos echei pente artous krithinous
 is little boy here who has five loaves barley
 ‘There is a little boy here who has five barley loaves.’
 b. estin paidarion hén hōde hos echei pente artous krithinous
 is little boy one here who has five loaves barley
 c. est puer unus hic qui habet quinque panes hordiacios
 is boy one here who has five breads barley

Here, the *Vulgate* corresponds exactly to the Byzantine type, and not to the older manuscripts modern that critical editions are based on.

While I duly acknowledge that these are potential problems, I do not think that these are critical. First, while being very different in some aspects, Latin, Ancient Greek and Biblical Hebrew are rather similar in their linguistic systems with regards to the expression of nominal indefiniteness: there is no indefinite article (the standard version is a bare singular), and they have a unity cardinal. Now, the question is: how different should we assume the cross-linguistic behaviour of unity cardinals to be in the first place, given that the main alternative is identical in the three languages? I venture that, as a working hypothesis, we should assume the meaning of *one* to be the same across languages, and its use should be governed by its meaning, and impacted by the distribution of its alternatives. Given these assumptions, we would not expect there to be any major differences.

Second, concerning the final source of the *Vulgate*, the presence or absence of *unus* might itself be taken as an indication of a possible textual source, and by comparing different textual traditions with respect to *unus* or *heîs*, we might end up retracing the history of the Bible (Hebrew and Greek for the Old Testament, and different Greek versions for the New). While certainly interesting, this is a task completely beyond what is doable in an article like the present one. It is, however, worth noting that in the rare instances where the *Vetus Latina* shows an influence from the Greek definite determiner (which is

³⁹This was pointed out to me by Elitzur Bar-Asher Siegal (p.c.)

rendered as the demonstrative *ille*), Jerome’s *Vulgate* follows a more classical and conservative Latin style, and avoids what might be interpreted as unidiomatic direct calques from Greek (see, e.g., Calboli 2009: 174).

Finally, notice that Calboli (2009: 177f.) writes in his conclusions on the borrowings from Greek into Latin (an article of 130 pages, where *unus* is not mentioned even once):

Despite many borrowings from Greek into Latin, some from Latin into Greek, and interference between the two languages, this interaction did not alter the core of the Latin language and grammar, because it never touched the core difference between the two languages. The core difference was the absence of the [definite] article in Latin and its presence in Greek with all the associated phenomena.

So, if the much more prevalent and grammatical definite article of Greek did not have an impact on Latin, we should probably not expect an impact of the Greek unity cardinal on Latin. Similarly, the only mention of the distribution of *unus* as influenced by Hebrew in Rubio (2009: 209) concerns the construction *unus et unus* (‘one by one’) as one instance of the use of reduplication in order to mark distributivity.⁴⁰

Summing up, we can thus state the following: i) the *Vulgate* (like other Latin translations of the Bible) does not slavishly copy its source word-for-word; ii) the *Vulgate* eliminated calques from the Greek determiner system present in preceding Latin translations; iii) the existing scholarly literature does not mention instances of unidiomatic or otherwise noteworthy Latin calques of Greek or Hebrew unity cardinals in the *Vulgate*⁴¹ (even though there have been claims of unity cardinals having the meaning/use of indefinite articles); iv) it is not clear that we should expect variation in the behaviour of unity cardinals between Latin, Ancient Greek and Biblical Hebrew in the first place.

However, the existence of several textual traditions with respect to the use of unity cardinals (in Greek and Latin) clearly raises the issue of variation: why did some authors/scribes add (or fail to copy) a unity cardinal in some contexts? The basic fact here is arguably that there were contexts that allowed, but did not require, the unity cardinal – and this was probably the case in both Ancient Greek and Latin, and it continues to be true for contemporary English.
